V. Medical Management

A. First Aid

It is very important for employees and/or contractors to get immediate treatment for every injury, regardless of how small it may seem. Basic first aid includes those actions that can be taken for an injured person(s) before medical help arrives.
Jobsite Supervisors and Safety Managers are the Company's designated first responders

and "First Aid Providers". In the absence of medical assistance within 3-4 minutes of the jobsite, First Aid Providers are responsible for rendering first aid. Jobsite Supervisors and Managers should be certified in First Aid/CPR ensuring that Company jobsites have a certified First Aid Provider available. Both CPR and first aid refresher courses should be completed every two years after initial certification.

B. First Aid Supplies and Kits

All trained first aid providers will be issued or allowed to purchase a first aid kit, that has the necessary supplies to treat injuries within the scope of his/her training. At the jobsite, first aid kits are required to be located in each jobsite Supervisor's vehicle and each Safety Manager's vehicle. These kits are normally accessed and maintained only by the Supervisor or Manager who was issued the kit. The kits are to be stored so that they are easily accessible. Each kit will include items in individually sealed packages. It is the responsibility of the Jobsite Supervisor or Safety Manager to ensure that their kit is maintained in the state it was initially provided and to refill their kit as soon as practicable after items are used. Note: First aid Kits may also be available in various other places on the rig site such as special safety trailers or mobile living quarters.

First aid kits are also centrally located in each office and shop. An inventory of first aid supplies will be maintained in the office by a member of the Safety Team. The Safety Team is charged with periodically assessing the specific needs of the Company's jobsites and augmenting first aid supplies/kits appropriately.

Each Company shop facility is equipped with a shower and eye wash station. These facilities are to be kept easily accessible in the event a person's body or eyes are exposed to injurious or corrosive materials.

C. Bloodborne Pathogens (BBP) – Exposure Control Plan

The Company has established a written BBP Plan and Program to control potential exposures to bloodborne pathogens such as the HIV or Hepatitis B virus. The Company has determined that its "designated first aid providers," that is, employees and/or contractors, whom the Company has designated to perform the duty of providing first aid and clean up of small amounts of blood or other potentially infectious materials, may incur BBP exposure. Accordingly, the Company expects designated first aid providers to be trained to understand BBP exposure and to implement the Company's BBP plan. Basic information is provided to all employees and/or contractors regarding BBP during orientation. BBP incidents are to be reported immediately to a Supervisor and/or a Safety Manager.

The bloodborne pathogen program is designed to minimize or eliminate personnel exposure to bloodborne pathogens. Bloodborne Pathogens are microorganisms present in the human blood and other body fluids that can cause and carry diseases including Human Immunodeficiency Virus (HIV) and Hepatitis B Virus (HBV).

D. Emergency Contacts and Transport

Emergency telephone numbers will be maintained by Rig Runner Inc on KPAEHS's Resources so a physician can be contacted in the event of an emergency. Whenever an employee has to be transported to a medical clinic, hospital or other treatment facility, the HSE Representative, job foreman or a supervisor will accompany the injured employee to the treatment facility and remain with him until he is either discharged or admitted. The employee should not be permitted to drive from the treatment facility while under the influence of medication and, if possible, should either be transported home by the supervisor or a family member or friend.
