OPERATION S.A.F.E. HEAT ILLNESS PREVENTION-DEHYDRATION

DID YOU KNOW… Do you ever feel that even despite drinking what seems like a substantial amount of water, you still feel thirsty and dehydrated? This is a common occurrence and can happen for a few reasons: there's a chance you aren't drinking enough water to meet your body's needs, you might have an electrolyte imbalance, or maybe something else is happening internally.

- **Drink Plenty of Fluids**
- **Medication Warnings:** If your doctor limits the amount you drink or has you on water pills, ask how much you should drink while the weather is hot.
- **Stay away from very sugary or alcoholic drinks**
- **Replace Salt and Minerals**
- **Encourage workers to hydrate themselves**
